

Portfolio Brief

Personal Information

Name: Nikhi Rathod

Semester: 3rd Semester

Branch: Computer Science and Engineering

About Me

I am a third-semester Computer Science and Engineering student interested in technology, programming, and building practical projects. Through my coursework and activities, I am developing my programming, problem-solving, version-control, and collaborative development skills. I enjoy learning through hands-on activities and documenting my progress.

Activity 1: VS Code Setup and Hello World

In Activity 1, I worked with VS Code and created a basic Hello World programming project. I learned the fundamentals of working with a development environment and managing a simple programming project. I also used GitLens to understand Git history and project changes.

Activity 2: Git and GitHub Setup

In Activity 2, I learned how to use Git and GitHub to manage and share programming work. I worked with repositories, commits, and pushing changes to GitHub. This helped me understand the basics of version control and how programming projects can be maintained online.

Activity 3: GitLens and Live Share

In Activity 3, I explored GitLens and Live Share for collaborative programming. I used Live Share to work with a teammate on a shared project and practiced making changes collaboratively. I also documented the collaboration and pushed the resulting work to GitHub.

Activity 4: LeetCode Practice Repository

In Activity 4, I created and maintained a LeetCode practice repository. I solved programming problems involving arrays and strings and documented my solutions and progress. I also added a bonus Reverse Linked List solution.

Technical Skills

- C programming
- Java fundamentals
- Python fundamentals
- HTML and CSS fundamentals
- Git and GitHub
- VS Code
- GitLens
- GitHub repositories and commits
- LeetCode problem solving

- Collaborative development with Live Share

Career / Learning Goal

My current goal is to strengthen my programming and problem-solving skills while building more practical projects. I want to continue improving my computer science fundamentals, develop a strong GitHub portfolio, and gain skills that will help me prepare for future internships and software development opportunities.

Portfolio Purpose

This portfolio will present my learning journey and the work completed during Activities 1–4. It will provide a simple way to view my projects, technical skills, and progress as a Computer Science student.

Prompt Log

Initial Generation Prompt

Create a one-page personal portfolio blog for Nikhi Rathod, a 3rd-semester Computer Science and Engineering student. Include About, Projects, Skills, and Contact sections. Use a professional but approachable tone and a modern, clean, student-friendly visual style with a soft attractive colour palette and responsive layout. Use only my real information and the descriptions of Activities 1–4 from my portfolio brief. Do not invent projects, skills, achievements, contact information, or other details. Include my actual GitHub links where available, especially my Hello World and LeetCode work. Create the complete portfolio for GitHub Pages.

Refinement 1

Please revise the portfolio to remove any details that were not explicitly provided in my original portfolio brief. In particular, remove or rewrite the references to compiler toolchain configuration, code reviews, and singly linked list pointer manipulation unless they are directly supported by my brief. Keep the descriptions of Activities 1–4 accurate and simple. Also make sure the GitHub Pages URL is displayed correctly as <https://nikhi-sys.github.io>. Do not add any new information, projects, skills, achievements, or claims.

What changed: Removed unsupported technical details and corrected the displayed GitHub Pages URL.

Refinement 2

Please make one final accuracy refinement to the Activity 4 project card. Remove “Python fundamentals” from the technologies listed specifically for Activity 4 because my original brief does not state that Python was used for this activity. Keep Python fundamentals in my overall Skills section. Do not change the other sections or add any new information.

What changed: Removed Python from the Activity 4 technology list while keeping it in the overall Skills section.

Refinement 3

What changed: Changed the visual design to a dark space-inspired theme while keeping the portfolio content and factual information unchanged.

Reflection

The first accuracy refinement produced the biggest improvement because it removed details that were not supported by my original brief. One thing the AI got wrong was adding technical details such as compiler configuration, code reviews, and pointer manipulation. I identified these issues by comparing the generated portfolio with my original brief. I corrected them by using follow-up prompts instead of manually editing the code.
