(A) Daily Coding Challenge
For September 29

Longest Word

Given a sentence, return the longest word in the sentence.

- Ignore periods (.) when determining word length.
- If multiple words are ties for the longest, return the first one that occurs.

```
JS function getLongestWord(sentence) {  
  return sentence;  
}
```

(A) Daily Coding Challenge
For September 28

CSV Header Parser

Given the first line of a comma-separated values (CSV) file, return an array containing the headings.

- The first line of a CSV file contains headings separated by commas.
- Remove any leading or trailing whitespace from each heading.

```
JS function getHeadings(csv) {  
  return csv;  
}
```

(A) Daily Coding Challenge
For September 27

Span Detector

Given a phone number in the format "+A (BBB) CCC-XXXX", where each letter represents a digit as follows:

- A represents the country code and can be any number of digits.
 - BBB represents the area code and will always be three digits.
 - CCC and XXXX represent the local number and will always be three and four digits long, respectively.
- Determine if it's a span number based on the following criteria...

```
JS function isSpanNumber(number) {  
  return number;  
}
```

(A) Daily Coding Challenge For September 29

Longest Word

Given a sentence, return the longest word in the sentence.

- Ignore periods (.) when determining word length.
- If multiple words are ties for the longest, return the first one that occurs.

```
function getLongestWord(sentence) {  
  return sentence;  
}
```

```
def get_longest_word(sentence):  
  return sentence
```

(A) Daily Coding Challenge For September 28

CSV Header Parser

Given the first line of a comma-separated values (CSV) file, return an array containing the headings.

- The first line of a CSV file contains headings separated by commas.
- Remove any leading or trailing whitespace from each heading.

```
function getHeadings(csv) {  
  return csv;  
}
```

```
def get_headings(csv):  
  return csv
```

(A) Daily Coding Challenge For September 27

Spam Detector

Given a phone number in the format "+A (BBB) CCC-0000", where each letter represents a digit as follows:

- A represents the country code and can be any number of digits.
- BBB represents the area code and will always be three digits.
- CCC and 0000 represent the local number and will always be three and four digits long, respectively.

Determine if it's a spam number based on the following criteria...

```
function isSpamNumber(n) {  
  return number;  
}
```

```
def is_spam(number):  
  return number
```

(A) Daily Coding Challenge For September 26

Caught Speeding

Given an array of numbers representing the speed at which vehicles were observed travelling, and a number representing the speed limit, return an array with two items, the number of vehicles that were speeding, followed by the average amount beyond the speed limit of those vehicles.

- If there were no vehicles speeding, return [0, 0].

```
function speeding(speeds, limit) {  
  return speeds;  
}
```

```
def speeding(speeds, limit):  
  return speeds
```

Solve it on the FreeCodeCamp Mobile App

(A) Daily Coding Challenge For September 25

2nd Largest

Given an array, return the second largest distinct number.

```
function secondLargest(arr) {  
  return arr;  
}
```

```
def second_largest(arr):  
  return arr
```

Solve it on the FreeCodeCamp Mobile App

(A) Daily Coding Challenge For September 24

Perfect Square

Given an integer, determine if it is a perfect square.

- A number is a perfect square if you can multiply an integer by itself to achieve the number. For example, 9 is a perfect square because you can multiply 3 by itself to get it.

```
function isPerfectSquare(n) {  
  return n;  
}
```

```
def is_perfect_square(n):  
  return n
```

Solve it on the FreeCodeCamp Mobile App

(A) Daily Coding Challenge For September 23

String Mirror

Given two strings, determine if the second string is a mirror of the first.

- A string is considered a mirror if it contains the same letters in reverse order.
- Treat uppercase and lowercase letters as distinct.
- Ignore all non-alphabetical characters.

```
function isMirror(str1, str2) {  
  return str1;  
}
```

```
def is_mirror(str1, str2):  
  return str1
```

Solve it on the FreeCodeCamp Mobile App

(A) Daily Coding Challenge For September 22

Digits vs Letters

Given a string, return "digits" if the string has more digits than letters, "letters" if it has more letters than digits, and "tie" if it has the same amount of digits and letters.

- Digits consist of 0-9.
- Letters consist of a-z in upper or lower case.
- Ignore any other characters.

```
function digitsOrLetters(str) {  
  return str;  
}
```

```
def digits_or_letters(s):  
  return s
```

(A) Daily Coding Challenge For September 21

Video Storage

Given a video size, a unit for the video size, a hard drive capacity, and a unit for the hard drive, return the number of videos the hard drive can store using the following constraints:

- The unit for the video size can be bytes ("B"), kilobytes ("KB"), megabytes ("MB"), or gigabytes ("GB").
- If not given one of the video units above, return "Invalid video unit".
- The unit of the hard drive capacity can be gigabytes ("GB") or terabytes ("TB").
- If not given one of the hard drive units above, return "Invalid drive unit".
- Return the number of whole videos the drive can fit.
- Use the following conversions...

```
function convertToBytes(bytes, kilobytes, megabytes, gigabytes) {  
  return bytes;  
}
```

```
def convert_to_bytes(bytes, kilobytes, megabytes, gigabytes):  
  return bytes
```

(A) Daily Coding Challenge For September 20

File Storage

Given a file size, a unit for the file size, and hard drive capacity in gigabytes (GB), return the number of files the hard drive can store using the following constraints:

- The unit for the file size can be bytes ("B"), kilobytes ("KB"), or megabytes ("MB").
- Return the number of whole files the drive can fit.
- Use the following conversions:

File	Capacity
1 KB	1024 bytes
1 MB	1,048,576 bytes
1 GB	1,073,741,824 bytes

For example, given 500, "KB", and 1 as arguments, determine how many 500 KB files can fit on a 1 GB hard drive.

```
function convertFileToBytes(fileSize, kilobytes, megabytes, gigabytes) {  
  return fileSize;  
}
```

```
def convert_file(file_size, kilobytes, megabytes, gigabytes):  
  return file_size
```
